DEPARTMENT OF STANDARDS MALAYSIA

DEVELOPMENT OF MALAYSIAN STANDARDS

The **Department of Standards Malaysia (DSM)** is the national standardisation and accreditation body.

The main function of the Department is to foster and promote standards, standardisation and accreditation as a means of advancing the national economy, promoting industrial efficiency and development, benefiting the health and safety of the public, protecting the consumers, facilitating domestic and international trade and furthering international cooperation in relation to standards and standardisation.

Malaysian Standards are developed through consensus by committees which comprise of balanced representation of producers, users, consumers and others with relevant interests, as may be appropriate to the subject in hand. To the greatest extent possible, Malaysian Standards are aligned to or are adoption of international standards. Approval of a standard as a Malaysian Standard is governed by the Standards of Malaysia Act 1996 (Act 549). Malaysian Standards are reviewed periodically. The use of Malaysian Standards is voluntary except in so far as they are made mandatory by regulatory authorities by means of regulations, local by-laws or any other similar ways.

The Department of Standards appoints **SIRIM Berhad** as the agent to develop Malaysian Standards. The Department also appoints SIRIM Berhad as the agent for distribution and sale of Malaysian Standards.

For further information on Malaysian Standards, please contact:

Department of Standards Malaysia

Level 1 & 2, Block C4, Parcel C
Federal Government Administrative Centre

CONTENTS

		Page
Committee representation		v
Foreword		vi
 SECTION 1: GENERAL		
1.1	Introduction	1
1.2	Scope	2
1.3	Normative references	2
1.4	Definitions	4
1.5	Safety	4
 SECTION 2: PRELIMINARY CONSIDERATIONS		
2.1	Primary objectives	5
2.2	Procedure	6
2.3	Earlier users and state of site	8
2.4	Aerial photographs and satellite imagery	9
 SECTION 3: GROUND INVESTIGATIONS		
3.1	Introduction	11
3.2	Types of ground investigation	15
3.3	Geological mapping for ground investigation	18
3.4	Extent of the ground investigation	18
3.5	General considerations in the selection of methods of ground investigation	24
3.6	The effect of ground conditions on the selection of methods of ground investigation	25
3.7	Aggressive ground conditions	31
3.8	Ground investigation over water	32
3.9	Personnel for ground investigation	34
3.10	Review during construction	37
 SECTION 4: FIELD INVESTIGATIONS		
4.1	Introduction	38
4.2	Excavations and boreholes	39
4.3	Frequency of sampling and testing in boreholes	47
4.4	Sampling the ground	50
4.5	Groundwater	65

CONTENTS (continued)

	Page
SECTION 5: FIELD TESTS	
5.1 Introduction	70
5.2 Tests in boreholes	72
5.3 Probing and penetration testing	91
5.4 Pumping tests	98
5.5 Analysis of pumping tests	103
5.6 Field density	110
5.7 In-situ stress measurements	112
5.8 Bearing tests	119
5.9 In-situ shear tests	123
5.10 Large-scale field trials	126
5.11 Back analysis of full-scale performance.....	129
5.12 Geophysical surveying	130
 SECTION 6: LABORATORY TESTS ON SAMPLES	
6.1 General principles	153
6.2 Sample storage and inspection facilities	155
6.3 Visual examination and description of laboratory samples	157
6.4 Tests on soil	165
6.5 Reporting test results	166
6.6 Test on Rock.....	166
 SECTION 7: DESCRIPTION OF SOILS AND ROCKS	
7.1 Description of soils	166
7.2 Classification of soils	184
7.3 Field procedures for description of principal soil type	185
7.4 Description and classification of rocks	187
7.5 Legends for engineering geological maps and plans	201
 SECTION 8: REPORTS AND INTERPRETATION	
8.1 General.....	202
8.2 Report	208

CONTENTS (continued)

	Page
Tables	
1	Size of commonly used core-barrels, casings and drill rods..... 44
2	Quality classification for soil samples 52
3	Mass of soil sample required for various laboratory tests 53
4	Details of dynamic probing test specifications 93
5	Values of $W(u)$ for values of u 107
6	Geophysical methods in ground investigation 133
7	Usefulness of engineering geophysical methods 134
8	Borehole logs and their applications and limitations..... 149
9	Categories of tests on soils specified in MS 1056 156
10	Common laboratory tests for soil..... 158
11	Common laboratory tests for rock 163
12	General identification and description of soils 170
13	Identification and description of soils 171
14	Aid to identification of rocks for engineering purposes 191
15	Terminology and checklist for rock discontinuity description 198
16	Recommended symbols for soils and rocks 203
17	Special symbols for borehole record 204
18	Symbols for general planar structures 205
19	Symbols for geological structures and boundaries 206
20	Typical example of explanation of symbols and abbreviations to accompany borehole log (see Figures 21 and 22) 213
Figures	
1	Basic details of open-tube sampler 55
2	Delft continuous sampler - 66 mm 56
3	A typical thin-walled sampler..... 58
4	Basic details of piston sampler 60
5	Typical piezometres 67
6	Values of intake factors, F , in borehole permeability tests 78
7	Relationship between dimensionless intake factor F/D and length to diameter ratio of piezometer L/D 79
8	Falling or rising head test - Example of calculation of basic time lag 80
9	Constant head test analysis by Gibson's method 82
10	Calculation of permeability from pumping tests 100
11	Typical drawdown time pumping responses (after Theis [78])..... 102
12	Theis method of superposition for solution of the non-equilibrium equation..... 108
13	Cooper-Jacob straight-line analysis 111
14a)	Measurement of in-situ stress - CSIRO cell 116
14b)	Measurement of in situ stress - Borre probe 117
14c)	Measurement of in-situ stress - Flat jack equipment – Typical layout 118
